

ABSTRACT

The present invention is a shopping cart child seat protection, organizer and play system allowing for the attachment of toys, bottles, and miscellaneous play things via lanyards and pockets while providing a protective cover over the upper frame rail of the fold out child seat found standard in most shopping carts. This alleviates danger and disruption in shopping with a small child who is likely to chew on the upper frame rail of the fold out child seat. The system is easily attached, and removably engagable via hook and loop connectors, being washable and reusable. The cloth construction of the system allows for easy storage in a purse, diaper bag, or pocket
